

Volume POC · Retest

Concept

The point of control (POC) is where the most volume traded — institutions defend it.

Without tick data, we approximate POC as the closing-price bucket with the most bar closes during the prior session. When price tests POC from above on the next day and rejects, that's a reversion magnet entry.

Rules

- Compute — Prior NY session bars (00:00 -> 17:00 NY) — bucket closes by $0.25 \times \text{ATR}$; POC = bucket with most closes.
- Touch — Current 15m wick within $0.3 \times \text{ATR}$ of POC.
- Trigger — Rejection candle (pin or engulfing).

Entry

- Market at trigger close.

Stop loss

- $1.0 \times \text{ATR}$ beyond POC on the wick side.

Take profit

- TP1: $1.1 \times \text{risk}$ · TP2: $1.5 \times \text{risk}$ · SL: $1.0 \times \text{risk}$
